

Zertifikat bei Lets Encrypt per Powershell beantragen

Es ist recht einfach sich ein Zertifikat über Let's Encrypt ausstellen zu lassen.

Das Powershell Skript habe ich auf den Desktop abgelegt.

Starte die Powershell und führe das Skript `.\LetsEncryptToPFX_1.0.ps1` mit den Optionen `.\LetsEncryptToPFX_1.0.ps1 -ExpirationEmail mail@joernwalter.de -PFXPassword xxxxxxxx -SanList www.joernwalter.de,joernwalter.de` aus.

Der Schalter `-ExpirationEmail` wird für die Ablaufbenachrichtigung benötigt, `-PFX` Password schützt den Privaten-Schlüssel vor unbefugten Zugriff und `-SanList` steht für Alternativer Antragstellernamen (Subject Alternative Name.)

Bestätige bei Punkt 2 die Ausführung mit „M“.

```
Administrator: Windows PowerShell
PS C:\users\joern\Desktop> .\LetsEncryptToPFX_v1.0.ps1 -ExpirationEmail mail@joernwalter.de -PFXPassword xxxxxxxx -SanList www.joernwalter.de,joernwalter.de
ANList www.joernwalter.de,joernwalter.de

Sicherheitswarnung
Führen Sie ausschließlich vertrauenswürdige Skripts aus. Skripts aus dem Internet können zwar nützlich sein, stellen jedoch auch eine potenzielle Gefahr für Ihren Computer dar. Wenn Sie diesem Skript vertrauen, lassen Sie mit dem Cmdlet "Unblock-File" die Ausführung des Skripts ohne die Warnmeldung zu. Möchten Sie "C:\users\joern\Desktop\LetsEncryptToPFX_v1.0.ps1" ausführen?
[N] Nicht ausführen [M] Einmal ausführen [H] Anhalten [?] Hilfe (Standard ist "N"): M

Add TXT record with data 7J5kaQEsUrT2o0WC31GCcpo4v1PLo0ebbSP-jZ46rcU to the FQDN _acme-challenge.www.joernwalter.de
Add TXT record with data m5eg0jnLBDji7si3orW57drgZsfB8c7MB8SHb7WqjM to the FQDN _acme-challenge.joernwalter.de
Manually add the green DNS TXT resource record above in the DNS-server responsible for the domain.
When you are done,
```

Zertifikat bei Lets Encrypt per Powershell beantragen

Punkt 3 verlangt zur Verifizierung der Eigentümerschaft der angegebenen Domain, in diesem Fall www.joernwalter.de und joernwalter.de einen Eintrag in DNS.

Dazu müssen wie angegeben 2 neue Records erstellt werden. Sobald diese angelegt sind, kann die Verifizierung gestartet werden.

Q

Hostname, Wert, Typ ...
